TITLE OP INVENTION: NOVEL POLYNUCLEOTIDES
FILE REFERENCE: 249-262

CURRENT APPLICATION NUMBER: US/10/156,761

GENERAL INFORMATION:

```
Sequence 2. Application US/09963959

Patent No. US20020165145A1

Patent No. US20020165145A1

PALEANT INFORMATION:

APPLICANT: Meyers, Rachel A.

TITLE OF INVENTION: 33521, A NOVEL HUMAN GUANINE NUCLEOTIDE EXCHANGE FAMILY MEMBER

TITLE OF INVENTION: AND USES THEREOF

PILE REFERENCE: 10440-095001

CURRENT APPLICATION NUMBER: US/09/963,959

CURRENT APPLICATION NUMBER: US/09/963,959

CURRENT FILING DATE: 2001-09-25

PRIOR APPLICATION NUMBER: 60/235,033

PRIOR APPLICATION NUMBER: 60/235,033

PRIOR PILLING DATE: 2000-09-25

NUMBER OF SEQ ID NOS: 13

SOPTWARE: PastSEQ for Windows Version 4.0

SEQ ID NO 2

LENGTH: 1701

TYPE: PRT

ORGANISM: Homo sapiens

CC encoding protein kinase (PTK and STK) families. The polynucleotides compound the kinase and the polypeptides may be used in the colorest (especially cancers of haematopoistic origin), cardiovascular commune related diseases (e.g. rheumatoid arthritis), neurological commune related diseases (e.g. schizophrenia), neurodegenerative disorders (e.g. disease (e.g. HIV) and reproductive disorders (e.g. sathma), infectious compounds (e.g. HIV) and reproductive disorders (e.g. infertility).

CC disease (e.g. HIV) and reproductive disorders (e.g. infertility).

CC used for gene therapy and as DNA probes in diagnostic assays.

CC of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.

                                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity thes such as: Immune system suppression, Activinyinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tang

                                                                                                                                                                              The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypaptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytrostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, and thrombolytic activity, cancer diagnosis and therapy, drug screening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   03-AUG-2000;

                                            CC The present sequence represents a partial polypeptide which has kinase CC activity. The kinase polymucleotides can be used to express the CC polypeptides, and as probes to identify nucleic acids encoding CC proteins having kinase activity. The kinase polypeptides and controls for peptides and isoelectric focusing markers, and as controls for peptide fragmentation. They also compare a number of therapeutic uses as kinases play a central role in the cellular signal transduction. The polypeptides could also be used to identify binding partner proteins. The polypeptides can also be used as a reagent to identify any proteins that the polypeptide regulates, and could also be used as a reagent to identify any proteins that the polypeptide may also be used for preparation of antibodies. The antibodies can be used in cassays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography.

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antishthmatic; antisheumatic; antibacterial; antivities antishfammatory; antithyroid; antishlergic; antibacterial; antiviral; dermatological, neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating

                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of novel human protein phosphatase and kinase protein pPHKP-5, as predicted from Incyre Clone ID No. CC 1271505CB1 (see AAF30480). Tissues that express PPHKP-5 (as a CC fraction of total tissues expressing PPHKP-5) include reproductive (0.288), gastrointestinal (0.212) and haematopoietic or immune (0.192). Diseases or conditions associated with tissues expressing PPHKP-5) include reproductive (0.192). Diseases or conditions associated with tissues expressing PPHKP-5) include C cancer (0.577), inflammation or trauma (0.327) and cell cancer (0.577), inflammation or trauma (0.327) and cell proliferation (0.308). The encoded protein hows homology to rat kinase. The invention provides human PPHKP-1 also provides expression vectors, host cells, antibodies, agonists and antagonists, as well as methods for diagnosing, treating or preventing disorders associated with expression of PPHKP, including gastrointestinal disorders, immune system disorders, neurological disorders and cell proliferative disorders, including cancer.
                                                                                                                                                                                                                                                                                                                                                         Matches 208;
                                                                                                                                                                                                                                                                                                                                                                       Query Match

CC also known as stress kinase inhibitor protein (SKIP-1) polypeptide. The CC also known as stress kinase inhibitor protein (SKIP-1) polypeptide. The CC signal in a cell. The polypeptide employed in the method is preferably CC htrb-1, htrb-1 N htrb-1 C, htrb-1 N C, htrb-3 N C. It is also useful for providing htrb agonist activity for CC activating an ERK-mediated signal e.g. AP-1-mediated gene activation signal, an estrogen receptor-mediated gene activation signal, an CC signal, an estrogen receptor-mediated gene activation signal, an CC in a cell. Htrb modulators are useful for modulating AP-1 mediated for induced inflammatory signal in a cell such as tumor necrosis factor (TNP) CC induced inflammatory signal, or an interleukin induced inflammatory compounds are useful for modulating AP-1 mediated CC and in thraspeutics or prophylactics. The htrb proteins are useful for cc signal. htrb proteins are useful in a creating analyor preventing diseases caused CC sporiasis, osteoporosis, diabetic retinopathy, myocardial infarction cc and cancers. The htrb therapeutice are useful for and cancers. The htrb therapeutics are useful for and infarction or autoimmune disorders. The present sequence represents cc the htrb-3 polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                             isolated human kinase polypeptides useful in the diagnosis, treatment and provention of cancer, immune disorders and disorders affecting growth and development -
                                                                                                                                                                                                                                            The invention provides human kinases (PKIN) and polynucleotides encoding PKIN. The PKIN polypeptides can be expressed using standard recombinant methodology. The PKIN polypeptides, polynucleotides, modulators and specific antibodies are useful in the diagnosis, treatment and prevention of cancer, immune disorders, disorders affecting growth and development, atherosclerosis, and other cardiovascular diseases, and lipid disorders and in the assessment of the effects of exogenous compounds on the expression of nucleic acid sequences of human kinases. The present sequence represents a human PKIN-10 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        17-FEB-2000; 2000US-0183682.

One hundred and twenty eight novel nucleic acid sequences, treating and diagnosing e.g. cancer, asthma and Alzheimer's useful for

Claim 6; Page 213-214; 290pp; English.

CC vasotropic, antiarreriosclerotic, antiinflammatory, dermatological, antiarreriosclerotic, muscular, anti-HTV, antiinflammatory, darmatological, cardiovascular, antifibrinolytic, hypotension, antiasthmatic, cardiant, communomodulator, antifibrinolytic, hypotension, antiasthmatic, cardiant, cimmunomodulator, antifibrinolytic, bypotension, antiasthmatic, cardiant, communomodulator, anticonvulsant, antidiabetic, tranquilliser, anticonvulsant, antidiabetic, tranquilliser, anticonvulsant, antidiabetic, tranquilliser, anticonvulsant, antidiabetic, carebroprotective, commontoriosic and contraceptive activities. The NS can be used in vaccines, communication vaccines, communication and be used for treating and contibodies from the present invention can be used for treating and contibodies from the present invention can be used for treating and contibodies, carcar, osteoporosis, rendometriosis, degenerative contisted diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, cataracts, restenses, atherosclerosis, inflammation, skin disorders, cataracts, restenses, atherosclerosis, inflammation, skin disorders, contisted by the contisted of the contisted by the cardiovascular contisted by the contisted by the cardiovascular contisted by the contisted by the cardiovascular contisted by ABL19691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB06037 to ABB06164. The nuver sequences (NS) can have cytostatic, osteopathic, gynaecological, neuroprotective, antirheumatic, antiarthritic, antipsoriatic, ophthalmological, virucide,

Sequence 278 \$

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ર્
ABL39691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB66037 to ABB66164. The novel sequences (NS) can have cytostatic, osteopathic, Synaecological, neuroprotective, antirheumatic, antiarthritic, antipsoriatic, ophthalmological, virucide, vssotropic, antiarteriosclerotic, antiinflammatory, dermatological, antorectic, muscular, anti-HIV, antiinflammatory, dermatological, anti-coagulant, antifibrinolytic, hypotension, antiasthmatic, cardiant, immunomodulator, anticonvulsant, antidiabetic, tranquilliser, antiulcer, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, nootropic and contraceptive activities. The NS can be used in vaccines, gene therapy and antisense therapy. Nucleic acids, expression vectors and disgnossing e.g. cancer, osteoporosis, endometriosis, degenerative psoriasis, deseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anorectic; muscular; antiinfertility; cardiovascular; anticoagulant; antifibrinolytic; hypotension; antiasthmatic; immunomodulator; cardiant; anticonvulsant; antidiabetic; tranquilliser; antidepressant; aeuroleptic; gastrointestinal; virucide; antiulcer; cerebroprotective; nootropic; contraceptive; vaccine; gene therapy; cancer; osteoporosis; dystonia; endometriosis; degenerative disease; multiple sclerosis; psoriasis; rheumatoid arthitis; cattaract; restenosis; atherosclerosis; glaucoma; inflammation; skin disorder; obesity; muscular dystrophy; AIDS; infertility; cardiovascular disease; coagulation disease; hypertension; ischaemia, asthma; immune disease; coagulation disease; hypertension; disbetes; anxiety; depression; schizophrenia; viral disease; stroke; gastric ulcer; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                        One hundred and twenty eight novel nucleic acid treating and diagnosing e.g. cancer, asthma and

      AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiinflammatory; antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; antiinflammatory; antithyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; altergic reaction; graft versus host disease; organ rejection; haematopoietic; cardiovascular disorder; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB4240 represent sequences used in the exemplification of the case of the control of the case of th
   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy technique.
                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutat responsible for genetic disorders or other traits and to assebiodiversity -

The invention

The invention relates to a single exon nucleic acid probe (SRNP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipiperoteinnemia, hyperlipideemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                  probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one o the probes of the invention.
